DISSERTATION  
ABSTRACT

In my dissertation *Essays on the Metaphysics of Quantum Mechanics*, I trace various philosophical puzzles of quantum mechanics back to their source—the *wave function*. I first clarify how its abstract mathematical representation is related to the concrete physical world. In Chapter 1, “An Intrinsic Account of Quantum Mechanics: Progress in Field’s Nominalistic Program,” I show that the wave function represents four intrinsic relations on physical space-time, uniquely up to certain symmetries. Since my intrinsic account dispenses any essential reference to mathematical objects, it also extends Field’s nominalistic program to the realm of quantum mechanics. In Chapter 2, “Our Fundamental Physical Space: An Essay on the Metaphysics of the Wave Function” (forthcoming, *The Journal of Philosophy*), I argue against configuration space realism, the view that physical space-time is “emergent from” the high-dimensional configuration space that the wave function lives on. Highlighting the roles of the dynamics and symmetries of the wave function, I show that physical space-time is more fundamental than configuration space. In Chapter 3, “The Best Summary of the Quantum World: The Universal Wave Function as a Humean Law,” I defend a Humean proposal about the wave function: the wave function is part of the Humean best system that supervenes on a separable mosaic. The defense provides a new geometric argument for the uniqueness of the wave function given the actual particle trajectories.

In clarifying the nature of the wave function in quantum mechanics, my dissertation brings together various themes in metaphysics and philosophy of science, including structuralism, functionalism, grounding, explanation, confirmation, objective probability, and laws of nature.
